

I CLAIM:

1. A portable apparatus for drying articles comprising:

A. a blower means;

B. a main conduit defining a main duct means extending therewithin capable carrying air flow therethrough, said main conduit also defining a main conduit inlet means and a main conduit outlet means each being in fluid flow communication with respect to said main duct means to facilitate air flowing into said main duct means through said main conduit inlet means and outwardly from said main duct means through said main conduit outlet means, said main conduit inlet means being operatively attached with respect to said blower means to receive air flow therefrom;

C. a distributing manifold defining a manifold duct means extending therewithin and further defining a manifold inlet means in fluid flow communication with respect to said manifold duct means for facilitating air flow therebetween, said manifold inlet means being operatively attached to said main conduit outlet means to receive air exiting therefrom, said distributing manifold defining a plurality of manifold outlet means therewithin;

- 24 D. a plurality of manifold attachment means with one  
25 mounted within each of said manifold outlet means  
26 to facilitate detachably securement thereto;
- 27 E. a plurality of drying fixture means each being  
28 detachably securable with respect to any one of  
29 said manifold attachment means for receiving of  
30 air flow therefrom, each of said drying fixture  
31 providing a means for drying articles of various  
32 different specific shapes, each of said drying  
33 fixture means including:
- 34 (1) a connecting conduit section defining a  
35 connecting section duct means extending  
36 therethrough for carrying air flow, said  
37 connecting conduit section further defining a  
38 drying fixture opening means therewithin in  
39 fluid flow communication with respect to said  
40 connecting section duct means;
- 41 (2) a fixture attachment means mounted on said  
42 connecting conduit section adjacent said  
43 drying fixture opening means and being  
44 selectively securable with respect to any one  
45 of said manifold attachment means to  
46 detachably mount one of said drying fixture  
47 means with respect to said distributing  
48 manifold to allow fluid flow communication  
49 between said distributing manifold outlet

means and said drying fixture opening means  
for facilitating air flow into said  
connecting section duct means of said drying  
fixture means to facilitate drying therewith;

(3) a hanging conduit section defining a hanging  
section duct means extending therethrough,  
said hanging section duct means in direct  
fluid flow communication with respect to said  
connecting section duct means, said hanging  
conduit section defining a plurality of  
drying hole means therein which are in fluid  
flow communication with respect to said  
hanging section duct means for dispensing air  
outwardly therefrom for drying of an article  
positioned thereadjacent, said hanging  
conduit section adapted to receive an article  
detachably held thereadjacent to facilitate  
drying thereof as air flows outwardly  
therefrom through said drying hole means  
defined therewithin; and

(4) a fixture valve means positioned within said  
connecting conduit section of said drying  
fixture means and extending thereacross to  
control air flow through said connecting  
section duct means.

- 1 2. A portable apparatus for drying of articles as defined  
2 in Claim 1 wherein said blower means comprises a heated  
3 blower means for supplying of heated air to said main  
4 conduit to facilitate drying.
- 1 3. A portable apparatus for drying of articles as defined  
2 in Claim 1 wherein said main conduit further defines a  
3 scenting chamber means therewithin for selectively  
4 holding of scenting material therewithin for scenting  
5 of air passing through said main duct means.
- 1 4. A portable apparatus for drying of articles as defined  
2 in Claim 3 wherein said main conduit means further  
3 defines an access opening means therein to provide  
4 access to said scenting chamber means for maintenance  
5 therewithin, said main conduit means further defining  
6 an access door means movable between a closed position  
7 extending across said access opening means for sealing  
8 thereof and an opened position to provide access  
9 through said access opening means into said scenting  
10 chamber means.
- 1 5. A portable apparatus for drying of articles as defined  
2 in Claim 1 wherein each of said fixture valve means is  
3 movable to a completely opened position to allow full  
4 air flow through said connecting conduit section of

5        said drying fixture means and to a completely closed  
6        position to prevent any air flow through said  
7        connecting conduit section of said drying fixture means  
8        and to any intermediate position therebetween to  
9        restrict air flow through said connecting conduit  
10       section of said drying fixture means.

- 1       6. A portable apparatus for drying of articles as defined  
2       in Claim 1 wherein said hanging conduit section of each  
3       of said drying fixture means is of an adjustable size  
4       and includes:
- 5       A. a first hanging member defining a portion of said  
6       hanging section duct means therewith, said first  
7       hanging member defining a plurality of said drying  
8       hole means therewithin; and
- 9       B. a second hanging member defining a portion of said  
10       hanging section duct means therewith, said first  
11       hanging member defining a plurality of said drying  
12       hole means therewithin, said second hanging member  
13       positioned in telescoping engagement with respect  
14       to said first hanging member and movable in  
15       telescoping manner with respect thereto to vary  
16       the overall dimensions of said hanging conduit  
17       section of said drying fixture means for  
18       facilitating usage thereof with articles of  
19       various sizes for drying adjacently positioned

20

thereupon.

1

7. A portable apparatus for drying of articles as defined  
in Claim 6 wherein said hanging conduit section  
includes a set screw means engageable with respect to  
said first hanging member and said second hanging  
member for selectively preventing telescoping movement  
therebetween when fully engaged while allowing  
telescoping movement therebetween when disengaged.

2

3

4

5

6

7

1

8. A portable apparatus for drying of articles as defined  
in Claim 1 wherein said drying fixture means includes a  
deodorizing means attachable with respect to said  
drying fixture means to facilitate deodorizing of  
articles while drying positioned thereupon.

2

3

4

5

1

9. A portable apparatus for drying of articles as defined  
in Claim 1 wherein said distributing manifold includes:  
A. a fixed manifold member secured with respect to  
said main conduit and having a fixed  
configuration, said fixed manifold member defining  
said manifold inlet means, said manifold inlet  
means being positioned by said fixed manifold  
member in fluid flow communication with respect to  
said main conduit outlet means to facilitate air  
flow therebetween, said fixed manifold member

2

3

4

5

6

7

8

9

10

11 defining a first manifold outlet and a second  
12 manifold outlet therein, said fixed manifold  
13 member also defining a left fixed manifold exit  
14 aperture and a right fixed manifold exit aperture  
15 therewithin;

16 B. a left adjustable manifold member detachably  
17 secured with respect to said left fixed manifold  
18 exit aperture for receiving air flow therefrom,  
19 said left adjustable manifold member having an  
20 adjustable configuration; and

21 C. a right adjustable manifold member detachably  
22 secured with respect to said right fixed manifold  
23 exit aperture for receiving air flow therefrom,  
24 said right adjustable manifold member having an  
25 adjustable configuration.

1 10. A portable apparatus for drying of articles as defined  
2 in Claim 9 further comprising a first manifold  
3 attachment means positioned within said first manifold  
4 outlet to selectively facilitate securement of a drying  
5 fixture means with respect thereto and further  
6 comprising a second manifold attachment means  
7 positioned within said second manifold outlet to  
8 selectively facilitate securement of a drying fixture  
9 means with respect thereto.

11. A portable apparatus for drying of articles as defined  
in Claim 10 wherein said left adjustable manifold  
member comprises:
- A. a left linking adjustable conduit section  
detachably secured with respect to said left fixed  
manifold exit aperture for receiving air flow  
therefrom; and
  - B. a first left adjustable conduit section detachably  
connected with respect to said left linking  
adjustable conduit section to receive air flow  
therefrom;
  - C. a second left adjustable conduit section also  
being detachably connected with respect to said  
left linking adjustable conduit section to receive  
air flow therefrom;
  - D. a first left splitting conduit connected with  
respect to said first left adjustable conduit  
section to receive air flow therefrom, said first  
left splitting conduit defining a third manifold  
outlet and a fourth manifold outlet therewithin;  
and
  - E. a second left splitting conduit connected with  
respect to said second left adjustable conduit  
section to receive air flow therefrom, said second  
left splitting conduit defining a fifth manifold  
outlet and a sixth manifold outlet therewithin.

1 12. A portable apparatus for drying of articles as defined  
2 in Claim 11 further comprising a third manifold  
3 attachment means positioned within said third manifold  
4 outlet to selectively facilitate securement of a drying  
5 fixture means with respect thereto and further  
6 comprising a fourth manifold attachment means  
7 positioned within said fourth manifold outlet to  
8 selectively facilitate securement of a drying fixture  
9 means with respect thereto and further comprising a  
10 fifth manifold attachment means positioned within said  
11 fifth manifold outlet to selectively facilitate  
12 securement of a drying fixture means with respect  
13 thereto and further comprising a sixth manifold  
14 attachment means positioned within said sixth manifold  
15 outlet to selectively facilitate securement of a drying  
16 fixture means with respect thereto.

1 13. A portable apparatus for drying of articles as defined  
2 in Claim 12 further comprising a first left valve means  
3 positioned within said first left adjustable conduit  
4 section to control air flow therethrough to said third  
5 manifold outlet and said fourth manifold outlet and  
6 further comprising a second left valve means positioned  
7 within said second left adjustable conduit section to  
8 control air flow therethrough to said fifth manifold

9           outlet and said sixth manifold outlet.

1           14. A portable apparatus for drying of articles as defined  
2           in Claim 13 wherein said right adjustable manifold  
3           member comprises:

- 4           A.   a right linking adjustable conduit section  
5                detachably secured with respect to said right  
6                fixed manifold exit aperture for receiving air  
7                flow therefrom; and  
8           B.   a first right adjustable conduit section  
9                detachably connected with respect to said right  
10              linking adjustable conduit section to receive air  
11              flow therefrom;  
12           C.   a second right adjustable conduit section also  
13                being detachably connected with respect to said  
14                right linking adjustable conduit section to  
15                receive air flow therefrom;  
16           D.   a first right splitting conduit connected with  
17                respect to said first right adjustable conduit  
18                section to receive air flow therefrom, said first  
19                right splitting conduit defining a seventh  
20                manifold outlet and a eighth manifold outlet  
21                therewithin; and  
22           E.   a second right splitting conduit connected with  
23                respect to said second right adjustable conduit  
24                section to receive air flow therefrom, said second

25 right splitting conduit defining a ninth manifold  
26 outlet and a tenth manifold outlet therewithin.

1 15. A portable apparatus for drying of articles as defined  
2 in Claim 14 further comprising a seventh manifold  
3 attachment means positioned within said seventh  
4 manifold outlet to selectively facilitate securement of  
5 a drying fixture means with respect thereto and further  
6 comprising a eighth manifold attachment means  
7 positioned within said eighth manifold outlet to  
8 selectively facilitate securement of a drying fixture  
9 means with respect thereto and further comprising a  
10 ninth manifold attachment means positioned within said  
11 ninth manifold outlet to selectively facilitate  
12 securement of a drying fixture means with respect  
13 thereto and further comprising a tenth manifold  
14 attachment means positioned within said tenth manifold  
15 outlet to selectively facilitate securement of a drying  
16 fixture means with respect thereto.

1 16. A portable apparatus for drying of articles as defined  
2 in Claim 15 further comprising a first right valve  
3 means positioned within said first right adjustable  
4 conduit section to control air flow therethrough to  
5 said seventh manifold outlet and said eighth manifold  
6 outlet and further comprising a second right valve

7 means positioned within said second right adjustable  
8 conduit section to control air flow therethrough to  
9 said ninth manifold outlet and said tenth manifold  
10 outlet.

1 17. A portable apparatus for drying of articles as defined  
2 in Claim 1 wherein one of said plurality of drying  
3 fixture means comprises a glove fixture wherein said  
4 hanging conduit section thereof includes a hand loop  
5 section being generally circular in shape and a thumb  
6 section being generally longitudinally in shape which  
7 are positioned adjacent to one another to facilitate  
8 placement of a glove thereupon for enhancing drying  
9 thereof during operation of said blower means.

1 18. A portable apparatus for drying of articles as defined  
2 in Claim 1 wherein one of said plurality of drying  
3 fixture means includes a headgear fixture wherein said  
4 hanging conduit section thereof includes a rounded head  
5 section and wherein said connecting conduit section  
6 defines a chin support section defined in a plane  
7 immediately adjacent said rounded head section to  
8 facilitating placement of headgear thereupon for  
9 enhancing drying thereof during operation of said  
10 blower means.

1 19. A portable apparatus for drying of articles as defined  
2 in Claim 1 wherein one of said plurality of drying  
3 fixture means comprises a footwear fixture wherein said  
4 hanging conduit section thereof includes a plurality of  
5 L-shaped loop section to facilitate placement of at  
6 least one footwear item thereupon for enhancing drying  
7 thereof during operation of said blower means.

1 20. A portable apparatus for drying of articles as defined  
2 in Claim 1 wherein one of said plurality of drying  
3 fixture means comprises a long pants fixture wherein  
4 said hanging conduit section thereof includes a first  
5 pants section and a second pants section positioned  
6 spatially apart and extending generally parallel to one  
7 another, said first pants section and said second pants  
8 section each being of a tapered cylindrical shape to  
9 facilitate placement of a long pants thereupon for  
10 enhancing drying thereof during operation of said  
11 blower means.

1 21. A portable apparatus for drying of articles as defined  
2 in Claim 1 wherein one of said plurality of drying  
3 fixture means comprises a cup shorts fixture wherein  
4 said hanging conduit section thereof includes a first  
5 short pants section and a second short pants section  
6 extending generally parallel to one another and each

7 being of a tapered cylindrical shape, said cup shorts  
8 fixture further including a crotch cup section  
9 extending laterally between said first short pants  
10 section and said second short pants section to  
11 facilitate drying, said cup shorts fixture adapted to  
12 facilitate placement of cup short pants with a crotch  
13 cup area upon said first short pants section and upon  
14 said second short pants section with the crotch area  
15 thereof extending over said crotch cup section for  
16 enhancing drying thereof during operation of said  
17 blower means.

1 22. A portable apparatus for drying of articles as defined  
2 in Claim 1 wherein one of said plurality of drying  
3 fixture means comprises a upper body fixture wherein  
4 said hanging conduit section thereof includes a rounded  
5 chest section and a first arm section extending  
6 outwardly and downwardly therefrom and a second arm  
7 section extending outwardly and downwardly oppositely  
8 from said first arm section to facilitate placement of  
9 an upper body garment thereupon for enhancing drying  
10 thereof during operation of said blower means.

1 23. A portable apparatus for drying of articles as defined  
2 in Claim 1 wherein one of said plurality of drying  
3 fixture means comprises a leg protector fixture wherein

4        said hanging conduit section thereof includes a first  
5        longitudinal section and a second longitudinal section  
6        each shaped generally longitudinally cylindrically and  
7        oriented parallel with respect to one another to  
8        facilitate placement of at least one leg protecting  
9        member thereupon for enhancing drying thereof during  
10       operation of said blower means.

1       24. A portable apparatus for drying of articles as defined  
2       in Claim 1 wherein one of said plurality of drying  
3       fixture means comprises an elbow pad fixture wherein  
4       said hanging conduit section thereof includes an first  
5       upper arm section and a first lower arm section  
6       extending longitudinally and oriented at an obtuse  
7       angle with respect to one another and wherein said  
8       hanging conduit section further includes an second  
9       upper arm section and a second lower arm section  
10       extending longitudinally and oriented at an obtuse  
11       angle with respect to one another in order to  
12       facilitate positioning of a pair of elbow pads adjacent  
13       to one another on said hanging conduit section for  
14       enhancing drying thereof during operation of said  
15       blower means.

1       25. A portable apparatus for drying of articles as defined  
2       in Claim 1 wherein one of said plurality of drying

3 fixture means comprises a chest protection fixture  
4 wherein said hanging conduit section thereof includes a  
5 rectangular chest section and a left arm section  
6 extending outwardly and downwardly therefrom and a  
7 right arm section extending outwardly and downwardly  
8 oppositely from said left arm section to facilitate  
9 placement of a chest protection apparatus thereupon for  
10 enhancing drying thereof during operation of said  
11 blower means.

1 26. A portable apparatus for drying of articles as defined  
2 in Claim 9 further comprising a left capping means  
3 detachably securable with respect to said left fixed  
4 manifold exit aperture means for selectively closing  
5 same and preventing air flow therethrough and further  
6 comprising a right capping means detachably securable  
7 with respect to said right fixed manifold exit aperture  
8 means for selectively closing same and preventing air  
9 flow therethrough.

1 27. A portable apparatus for drying articles comprising:  
2 A. a blower means included a heating means to  
3 facilitate supplying of heated air for warming and  
4 drying;  
5 B. a main conduit defining a main duct means  
6 extending therewithin capable carrying air flow

7 therethrough, said main conduit also defining a  
8 main conduit inlet means and a main conduit outlet  
9 means each being in fluid flow communication with  
10 respect to said main duct means to facilitate air  
11 flowing into said main duct means through said  
12 main conduit inlet means and outwardly from said  
13 main duct means through said main conduit outlet  
14 means, said main conduit inlet means being  
15 operatively attached with respect to said blower  
16 means to receive air flow therefrom, said main  
17 conduit further defining a scenting chamber means  
18 therewithin for selectively holding of scenting  
19 material therewithin for scenting of air passing  
20 through said main duct means;

21 C. a distributing manifold defining a manifold duct  
22 means extending therewithin and further defining a  
23 manifold inlet means in fluid flow communication  
24 with respect to said manifold duct means for  
25 facilitating air flow therebetween, said manifold  
26 inlet means being operatively attached to said  
27 main conduit outlet means to receive air exiting  
28 therefrom, said distributing manifold defining a  
29 plurality of manifold outlet means therewithin;

30 D. a plurality of manifold attachment means with one  
31 mounted within each of said manifold outlet means  
32 to facilitate detachably securement thereto;

33 E. a plurality of drying fixture means each being  
34 detachably securable with respect to any one of  
35 said manifold attachment means for receiving of  
36 air flow therefrom, each of said drying fixture  
37 providing a means for drying articles of various  
38 different specific shapes, each of said drying  
39 fixture means including:  
40 (1) a connecting conduit section defining a  
41 connecting section duct means extending  
42 therethrough for carrying air flow, said  
43 connecting conduit section further defining a  
44 drying fixture opening means therewithin in  
45 fluid flow communication with respect to said  
46 connecting section duct means;  
47 (2) a fixture attachment means mounted on said  
48 connecting conduit section adjacent said  
49 drying fixture opening means and being  
50 selectively securable with respect to any one  
51 of said manifold attachment means to  
52 detachably mount one of said drying fixture  
53 means with respect to said distributing  
54 manifold to allow fluid flow communication  
55 between said distributing manifold outlet  
56 means and said drying fixture opening means  
57 for facilitating air flow into said  
58 connecting section duct means of said drying

59 fixture means to facilitate drying therewith;

60 (3) a hanging conduit section defining a hanging  
61 section duct means extending therethrough,  
62 said hanging section duct means in direct  
63 fluid flow communication with respect to said  
64 connecting section duct means, said hanging  
65 conduit section defining a plurality of  
66 drying hole means therein which are in fluid  
67 flow communication with respect to said  
68 hanging section duct means for dispensing air  
69 outwardly therefrom for drying of an article  
70 positioned thereadjacent, said hanging  
71 conduit section adapted to receive an article  
72 detachably held thereadjacent to facilitate  
73 drying thereof as air flows outwardly  
74 therefrom through said drying hole means  
75 defined therewithin, said hanging conduit  
76 section of each of said drying fixture means  
77 being of adjustable size and including:

78 (a) a first hanging member defining a  
79 portion of said hanging section duct  
80 means therewith, said first hanging  
81 member defining a plurality of said  
82 drying hole means therewithin;

83 (b) a second hanging member defining a  
84 portion of said hanging section duct

means therewith, said first hanging member defining a plurality of said drying hole means therewithin, said second hanging member positioned in telescoping engagement with respect to said first hanging member and movable in telescopic manner with respect thereto to vary the overall dimensions of said hanging conduit section of said drying fixture means for facilitating usage thereof with articles of various sizes for drying adjacently positioned thereupon; and

- (4) a fixture valve means positioned within said connecting conduit section of each of said drying fixture means and extending thereacross to control air flow through said connecting section duct means, each of said fixture valve means being movable to a completely opened position to allow full air flow through said connecting conduit section of said drying fixture means and to a completely closed position to prevent any air flow through said connecting conduit section of said drying fixture means and to any intermediate position therebetween to

111 restrict air flow through said connecting  
112 conduit section of said drying fixture means.

- 1 28. A portable apparatus for drying articles comprising:
- 2 A. a blower means included a heating means to  
3 facilitate supplying of heated air for warming and  
4 drying;
- 5 B. a main conduit defining a main duct means  
6 extending therewithin capable carrying air flow  
7 therethrough, said main conduit also defining a  
8 main conduit inlet means and a main conduit outlet  
9 means each being in fluid flow communication with  
10 respect to said main duct means to facilitate air  
11 flowing into said main duct means through said  
12 main conduit inlet means and outwardly from said  
13 main duct means through said main conduit outlet  
14 means, said main conduit inlet means being  
15 operatively attached with respect to said blower  
16 means to receive air flow therefrom, said main  
17 conduit further defining a scenting chamber means  
18 therewithin for selectively holding of scenting  
19 material therewithin for scenting of air passing  
20 through said main duct means, said main conduit  
21 means further defining an access opening means  
22 therein to provide access to said scenting chamber  
23 means for maintenance therewithin, said main

24 conduit means further defining an access door  
25 means movable between a closed position extending  
26 across said access opening means for sealing  
27 thereof and an opened position to provide access  
28 through said access opening means into said  
29 scenting chamber means;

30 C. a distributing manifold defining a manifold duct  
31 means extending therewithin and further defining a  
32 manifold inlet means in fluid flow communication  
33 with respect to said manifold duct means for  
34 facilitating air flow therebetween, said manifold  
35 inlet means being operatively attached to said  
36 main conduit outlet means to receive air exiting  
37 therefrom, said distributing manifold defining a  
38 plurality of manifold outlet means therewithin,  
39 said distributing manifold further including;

40 (1) a fixed manifold member secured with respect  
41 to said main conduit and having a fixed  
42 configuration, said fixed manifold member  
43 defining said manifold inlet means, said  
44 manifold inlet means being positioned by said  
45 fixed manifold member in fluid flow  
46 communication with respect to said main  
47 conduit outlet means to facilitate air flow  
48 therebetween, said fixed manifold member  
49 defining a first manifold outlet and a second

manifold outlet therein, said fixed manifold member also defining a left fixed manifold exit aperture and a right fixed manifold exit aperture therewithin;

(2) a left adjustable manifold member detachably securable with respect to said left fixed manifold exit aperture for receiving air flow therefrom, said left adjustable manifold member having an adjustable configuration, said left adjustable manifold member comprising:

(a) a left linking adjustable conduit section detachably secured with respect to said left fixed manifold exit aperture for receiving air flow therefrom;

(b) a first left adjustable conduit section detachably connected with respect to said left linking adjustable conduit section to receive air flow therefrom;

(c) a second left adjustable conduit section also being detachably connected with respect to said left linking adjustable conduit section to receive air flow therefrom;

(d) a first left splitting conduit connected

76 with respect to said first left  
77 adjustable conduit section to receive  
78 air flow therefrom, said first left  
79 splitting conduit defining a third  
80 manifold outlet and a fourth manifold  
81 outlet therewithin; and  
82 (e) a second left splitting conduit  
83 connected with respect to said second  
84 left adjustable conduit section to  
85 receive air flow therefrom, said second  
86 left splitting conduit defining a fifth  
87 manifold outlet and a sixth manifold  
88 outlet therewithin;  
89 (f) a first left valve means positioned  
90 within said first left adjustable  
91 conduit section to control air flow  
92 therethrough to said third manifold  
93 outlet and said fourth manifold outlet  
94 (g) a second left valve means positioned  
95 within said second left adjustable  
96 conduit section to control air flow  
97 therethrough to said fifth manifold  
98 outlet and said sixth manifold outlet;  
99 (3) a right adjustable manifold member detachably  
100 securable with respect to said right fixed  
101 manifold exit aperture for receiving air flow

102                   therefrom, said right adjustable manifold  
103                   member having an adjustable configuration,  
104                   said right adjustable manifold member  
105                   comprising:  
106                   (a) a right linking adjustable conduit  
107                         section detachably secured with respect  
108                         to said right fixed manifold exit  
109                         aperture for receiving air flow  
110                         therefrom;  
111                   (b) a first right adjustable conduit section  
112                         detachably connected with respect to  
113                         said right linking adjustable conduit  
114                         section to receive air flow therefrom;  
115                   (c) a second right adjustable conduit  
116                         section also being detachably connected  
117                         with respect to said right linking  
118                         adjustable conduit section to receive  
119                         air flow therefrom;  
120                   (d) a first right splitting conduit  
121                         connected with respect to said first  
122                         right adjustable conduit section to  
123                         receive air flow therefrom, said first  
124                         right splitting conduit defining a  
125                         seventh manifold outlet and a eighth  
126                         manifold outlet therewithin; and  
127                   (e) a second right splitting conduit

128 connected with respect to said second  
129 right adjustable conduit section to  
130 receive air flow therefrom, said second  
131 right splitting conduit defining a ninth  
132 manifold outlet and a tenth manifold  
133 outlet therewithin;

134 (f) a first right valve means positioned  
135 within said first right adjustable  
136 conduit section to control air flow  
137 therethrough to said seventh manifold  
138 outlet and said eighth manifold outlet;

139 (g) a second right valve means positioned  
140 within said second right adjustable  
141 conduit section to control air flow  
142 therethrough to said ninth manifold  
143 outlet and said tenth manifold outlet;

144 D. a plurality of manifold attachment means  
145 including:

146 (1) a first manifold attachment means positioned  
147 within said first manifold outlet to  
148 selectively facilitate securement with  
149 respect thereto;

150 (2) a second manifold attachment means positioned  
151 within said second manifold outlet to  
152 selectively facilitate securement with  
153 respect thereto;

- 154 (3) a third manifold attachment means positioned  
155 within said third manifold outlet to  
156 selectively facilitate securement with  
157 respect thereto;
- 158 (4) a fourth manifold attachment means positioned  
159 within said fourth manifold outlet to  
160 selectively facilitate securement with  
161 respect thereto;
- 162 (5) a fifth manifold attachment means positioned  
163 within said fifth manifold outlet to  
164 selectively facilitate securement with  
165 respect thereto;
- 166 (6) a sixth manifold attachment means positioned  
167 within said sixth manifold outlet to  
168 selectively facilitate securement with  
169 respect thereto;
- 170 (7) a seventh manifold attachment means  
171 positioned within said seventh manifold  
172 outlet to selectively facilitate securement  
173 with respect thereto;
- 174 (8) a eighth manifold attachment means positioned  
175 within said eighth manifold outlet to  
176 selectively facilitate securement with  
177 respect thereto;
- 178 (9) a ninth manifold attachment means positioned  
179 within said ninth manifold outlet to

180  
181  
182  
183  
184  
185  
186  
187

203  
204  
205

selectively facilitate securement with respect thereto;  
(10) a tenth manifold attachment means positioned within said tenth manifold outlet to selectively facilitate securement with respect thereto;

E. a plurality of drying fixture means each being detachably securable with respect to any one of said manifold attachment means for receiving of air flow therefrom, each of said drying fixture providing a means for drying articles of various different specific shapes, each of said drying fixture means including:  
(1) a connecting conduit section defining a connecting section duct means extending therethrough for carrying air flow, said connecting conduit section further defining a drying fixture opening means therewithin in fluid flow communication with respect to said connecting section duct means;  
(2) a fixture attachment means mounted on said connecting conduit section adjacent said drying fixture opening means and being selectively securable with respect to any one of said manifold attachment means to detachably mount one of said drying fixture

206 means with respect to said distributing  
207 manifold to allow fluid flow communication  
208 between said distributing manifold outlet  
209 means and said drying fixture opening means  
210 for facilitating air flow into said  
211 connecting section duct means of said drying  
212 fixture means to facilitate drying therewith;  
213 (3) a hanging conduit section defining a hanging  
214 section duct means extending therethrough,  
215 said hanging section duct means in direct  
216 fluid flow communication with respect to said  
217 connecting section duct means, said hanging  
218 conduit section defining a plurality of  
219 drying hole means therein which are in fluid  
220 flow communication with respect to said  
221 hanging section duct means for dispensing air  
222 outwardly therefrom for drying of an article  
223 positioned thereadjacent, said hanging  
224 conduit section adapted to receive an article  
225 detachably held thereadjacent to facilitate  
226 drying thereof as air flows outwardly  
227 therefrom through said drying hole means  
228 defined therewithin, said hanging conduit  
229 section of each of said drying fixture means  
230 being of adjustable size and including:  
231 (a) a first hanging member defining a

232 portion of said hanging section duct  
233 means therewith, said first hanging  
234 member defining a plurality of said  
235 drying hole means therewithin;

236 (b) a second hanging member defining a  
237 portion of said hanging section duct  
238 means therewith, said first hanging  
239 member defining a plurality of said  
240 drying hole means therewithin, said  
241 second hanging member positioned in  
242 telescoping engagement with respect to  
243 said first hanging member and movable in  
244 a telescopic manner with respect thereto  
245 to vary the overall dimensions of said  
246 hanging conduit section of said drying  
247 fixture means for facilitating usage  
248 thereof with articles of various sizes  
249 for drying adjacently positioned  
250 thereupon;

251 (c) a set screw means engageable with  
252 respect to said first hanging member and  
253 said second hanging member for  
254 selectively preventing telescoping  
255 movement therebetween when fully engaged  
256 while allowing telescoping movement  
257 therebetween when disengaged; and

258 F. a deodorizing means attachable with respect to any  
259 of said drying fixture means to facilitate  
260 deodorizing of articles while drying positioned  
261 thereupon.
